

Student Answer Sheet

Subject: Artificial Intelligence

Definition:

AI is the simulation of human intelligence by machines, covering learning, reasoning, and self-correction. Machines with AI can do tasks like speech recognition and decision-making.

Body:

Key branches: Machine Learning trains on data; Deep Learning uses neural networks; NLP handles language; Computer Vision handles images. Main techniques are supervised, unsupervised, and reinforcement learning. Applications: healthcare diagnostics, fraud detection, self-driving cars.

Conclusion:

AI is transformative but raises ethical issues around bias, privacy, and jobs. Responsible, transparent AI is needed for positive societal impact.
