

Student Answer Sheet

Subject: Artificial Intelligence

Definition:

Artificial Intelligence (AI) is the simulation of human intelligence by machines. It includes learning, reasoning, and self-correction capabilities. AI can perform tasks like speech recognition, visual perception, and complex decision-making.

Body:

AI stuff. Machine learning. Also deep learning. Healthcare and stuff.

Conclusion:

AI is a transformative force reshaping industries globally. Ethical considerations including privacy, bias, job displacement, and accountability must guide responsible AI development. Future advances in explainable AI and general AI will determine technology's long-term societal impact.
