

Student Answer Sheet

Subject: Artificial Intelligence

Definition:

Artificial Intelligence enables machines to simulate human intelligence including learning, reasoning, and self-correction. It allows computers to perform tasks like speech recognition, visual perception, and translation.

Body:

Key subfields of AI include Machine Learning (systems learn from data), Deep Learning (multi-layer neural networks), NLP (language processing), and Computer Vision (image interpretation). Main techniques are supervised, unsupervised, and reinforcement learning. AI applications span healthcare (diagnostics), finance (fraud detection), and autonomous vehicles.

Conclusion:

AI is a transformative technology with wide industrial impact. Ethical challenges like bias, privacy, and job displacement must be addressed through responsible and transparent AI development practices.
