

Student Answer Sheet

Subject: Artificial Intelligence

Definition:

AI (Artificial Intelligence) refers to machines simulating human intelligence. This includes learning from data, logical reasoning, and self-correction. AI enables speech recognition, image analysis, and decision-making.

Body:

Machine Learning, Deep Learning, NLP, and Computer Vision are AI branches. Supervised learning uses labelled data; unsupervised learning finds hidden patterns; reinforcement learning uses rewards. Applications: medical imaging in healthcare, anomaly detection in finance, path planning in robotics and autonomous vehicles.

Conclusion:

AI is reshaping society. Benefits include efficiency and automation. Ethical concerns: algorithmic bias, data privacy, and workforce disruption. Responsible AI needs explainability, fairness, and human oversight.
